

QC database:current situation

- Schema and data structure : ready
- Database access C++ library : ready
- ascii data to DB data program : ready

- Java interface : under development (found problems with objectivity for java)
- distributed network access : still to be tested

ISSUES

Debug/Test overall functionality:

- Install and test database on heterogeneous platforms
- Is the data structure adequate to describe and store production data?
- Did we foresee all necessary operation?
- Is the ascii program and coding easy to integrate with control programs?
- Is the ascii coding adequate to be distributed to external firms?
- Is the ascii coding adequate to the machines we use (ex: **wire tension meter**)

Discussion

- How much material is going to be produced in the next months?
- Is the data relative to material already produced at the production sites stored in some database? In which format?
- Shall we start to test the database?
